

Timesheet Entry and Job Costing Software

Technologies Used: Windows Client, ActiveX, Office Automation, MS Excel, Web-based client, Linux Server, MySQL This software allows employees to manually specify the number of hours they have worked on a particular project in a day using a Web interface over an intranet. It compares the time entered by employees against their Time In and Time Out data from an Attendance Machine for validation.

The software then reports the cost incurred on a particular project through a Windows client installed on the company Administration Staff computers. It provides a facility to check individual employee(s) salary expense as well as all the salary expense on a particular project. Its notable features are:

- Web interface for employees requiring no installation
- Windows-based heavy clients for reporting
- Central Database Server
- Accessible through Network
- Create Reports in Microsoft Excel format
